

Status of Claims

Claims 1, 2 and 3 (canceled).

Claim 4 (pending). The method of applying a medicament to the surface of a body cavity comprising the steps of:

- a) providing a container for said medicament having a laterally-oriented nozzle, and integral means for expelling said medicament through said nozzle;
- b) inserting said nozzle into said cavity;
- c) and operating said device for expelling said medicament while simultaneously rotating said nozzle through an arcuate path of movement to evenly coat said surface.

Claim 5 (new). A single use device for applying a fluid medicament to an internal genital areas comprising: a hollow elongated flexible body forming a cavity for containing said medicament, said body having an end portion forming an open neck, a hollow tube interconnected to said neck having a manually frangible sealed terminal, said tube extending laterally of said neck; whereby upon the tearing of said frangible seal terminal, and insertion of said device into said internal area, said body may be simultaneously rotated and pressed to distribute said medicament over a continuous arcuate path.

Claim 6 (new). A device in accordance with claim 5, in which said device is formed by blow molding of synthetic resinous material.

Claim 7 (new). A device for dispensing a medicament over the surface of an internal body cavity comprising: a generally cylindrical hollow main body for containing said medicament, said body having an open upper end, a manually-operated pump communicating with said body, said pump including a manually reciprocating member having a laterally-oriented nozzle, said manually-reciprocating member being axially fixed relative to said body; at least a portion of said device being insertable into said cavity following which operation of said pump causes dispensing of said medicament over a laterally-directed path upon rotation of said body.
